

LRP chargers are now charging all NiMH and NiCd batteries !

The difference of NiMH to NiCd batteries:

- More capacity due to higher energy density
- No memory-effect, several charge-cycles per day are possible
- Environment friendly, no use of Cadmium

User-guide:

Charging:

- Max. charge current **4 Amps**
- Use only chargers with special NiMH software (LRP)
- The peak-detection of NiMH batteries is different compared to NiCd , therefor the batteries are getting warmer (up to 45° C) during charging

Discharging:

- Attention ! Do not discharge NiMH-batteries with simple light-bulb or resistor
- **Do not deep discharge any NiMH cell !**
- Max. discharge-voltage 5,0 Volt for 6-cell pack
- For optimum discharging, we recommend the LRP NiMH- discharger No. 41350

Storage:

- Store your NiMH-packs with some voltage in them, we recommend to charge the battery if you're not going to use it for several days or weeks. Longer storing of full discharged NiMH-cells will hurt the cells. Discharge your partially charged cells the day before the next use with a quality discharger such as the LRP NiMH-discharger.
- You'll enjoy your NiMH-pack for a long time if you look at this few issues.
